Highlighting the use and purpose

→ = press keys after each other

+ = press keys at the same time

() = additional hint

Note: Some shortcuts (such as "*" or "l") may require additional keys (such as "Shift")

AVERAGE

For the average (AVERAGE) function, I wanted to be able to show the average number of tickets sold for each film. When advertising would be created for the store that was proposed, we wanted a number that could be shown that would show how popular the top 20 films had been so that a figure could be used in marketing materials to catch attention

The screenshot shows the Excel formula bar with the formula `=AVERAGE(O2:O21)` entered. Below it, a table displays summary data for the top 20 films. The table has columns for Title, Genre, and a numerical value.

	A	B	C
1		Title	Genre
22			
23		At-A-Glance Data	
24		Average number of tickets sold for each film	28,785,941
25		Maximum purchase price of a film	\$19.99

AVERAGE function input in formula bar and cells referenced

MAXIMUM

A MAX function was input here as I wanted to prevent over-charging on the store. The prices had been pre-set, so if I knew the maximum price that could be charged, this would give the store the ability to prevent erroneous large transactions that would have to be refunded

The screenshot shows the Excel formula bar with the formula `=MAX(I2:I21)` entered. Below it, a table displays summary data for the top 20 films. The table has columns for Title, Genre, and a numerical value.

	B	C
	Title	Genre
	Maximum purchase price of a film	\$19.99

MAX function input in formula bar and cells referenced

MINIMUM

Likewise I wanted to use the same function but for the minimum (MIN) price, so that we could prevented a lower than intended price being accepted at checkout stage, thus costing the store money

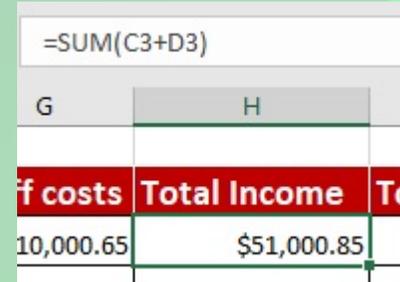

The screenshot shows the Excel formula bar with the formula `=MIN(I2:I21)` entered. Below it, a table displays summary data for the top 20 films. The table has columns for Title, Genre, and a numerical value.

	B	C
	Title	Genre
	Minimum purchase price	\$12.99

MIN function input in formula bar and cells referenced

SUM

The SUM function was used here as reports were going to be presented to management regarding running costs and profit. In this example I used the sum function to add together the values in two separate cells, representing the income from rental sales and purchase sales added together, so that we could see an initial pre-deduction profit

The screenshot shows the Excel formula bar with the formula `=SUM(C3+D3)`. Below it, a portion of a spreadsheet is visible with columns G and H. Row 3 has a red header with 'Total Income' in column H. Row 4 shows values: 10,000.65 in column G and \$51,000.85 in column H.

G	H
10,000.65	\$51,000.85

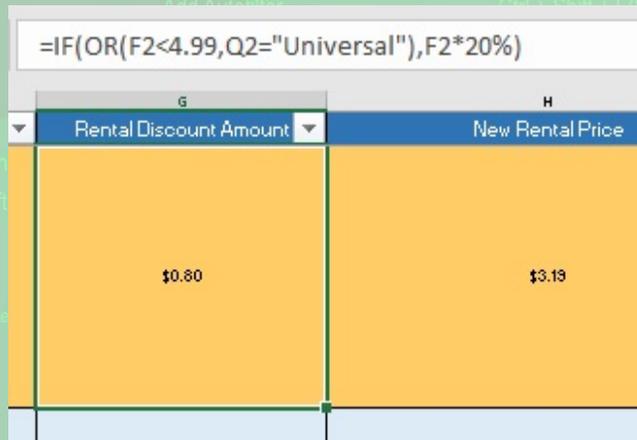

SUM function input in formula bar and cells referenced

IF, OR & LESS THAN

Multiple functions were used in this example, as multiple values need to be taken into account in a formula. I wanted to put an offer on film rentals to try and increase rental business. The distributor Universal had agreed to take part in the offer, and any film of theirs could be used in the offer regardless of the rental price, but for other distributors a 20% reduction could be applied only on any rental costing less than \$4.99. To do this, a formula had to be input so that IF a film was LESS THAN(<) \$4.99 to rent, OR the distributor was Universal, then the 20% reduction could be applied, and the cell the formula was used in would give the discount amount to be used at checkout

Formula starts with the IF part so that Excel knows a condition will be set

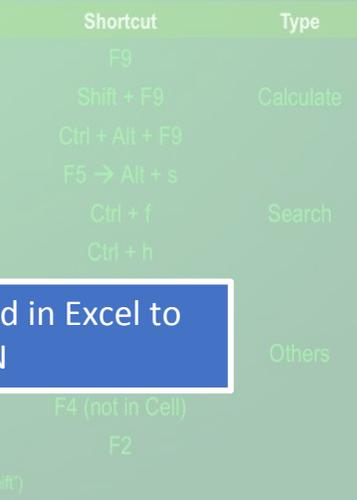

The left bracket is then input and OR is inserted to that multiple conditions will need to be taken into account

The screenshot shows the Excel formula bar with the formula `=IF(OR(F2<4.99,Q2="Universal"),F2*20%)`. Below it, a spreadsheet is visible with columns G and H. Column G is labeled 'Rental Discount Amount' and column H is labeled 'New Rental Price'. Row 2 shows values: \$0.80 in column G and \$3.19 in column H.

G	H
Rental Discount Amount	New Rental Price
\$0.80	\$3.19

The '<' symbol is used in Excel to represent LESS THAN

Shortcut	Type
F9	
Shift + F9	Calculate
Ctrl + Alt + F9	
F5 → Alt + s	
Ctrl + f	Search
Ctrl + h	
	Others
F4 (not in Cell)	
F2	

IF, AND & MORE THAN

Like the previous example, I wanted to use an offer to increase sales as well as rentals. Just like the rentals, 20% would be taken off the price of purchase, but this time the distributors were a lot less willing to take a hit on profits with this promotion. In the end, Universal were the only distributor who agreed to take part in this promotion, and the reduction could only be applied on films costing more than \$12.99. So a formula was created that said IF a film was put through on checkout that was MORE THAN (>) \$12.99 AND was distributed by Universal, then a 20% reduction could be applied

Formula starts with the IF part so that Excel knows a condition will be set

The screenshot shows the Excel formula bar containing the formula: `=IF(AND(I2>12.99,Q2="Universal"),I2*20%,0)`. Below the formula bar, a table is visible with columns for 'Purchase Price' and 'Purchase Price Discount Amount'. The 'Purchase Price' cell contains the value '\$19.99' and the 'Purchase Price Discount Amount' cell contains '\$0.00'.

The '>' symbol is used in Excel to represent MORE THAN

The left bracket is then input and AND is inserted to that multiple conditions will need to be met

COUNT

The COUNT function was used as management wanted to know how many of the films fell under which ratings, and this was for two reasons. Firstly, the higher the ratings, the less individuals there will be who are actually able to see the film, and so with higher ratings comes potentially less profit for a rental store, so this would need to be taken into account in accounting. Secondly, if there were a higher number of films with an 'R' rating, then a memo would need to go out to staff to be particularly vigilant to prevent any unauthorised rentals/sales

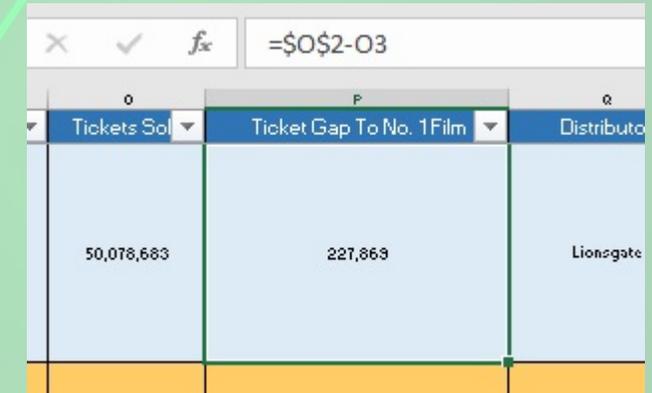

The screenshot shows the Excel formula bar containing the formula: `=COUNTIF(D2:D21,"PG")`. Below the formula bar, a table is visible with columns for 'Genre', 'Certificate', 'Rating', and 'Rental Price'. The 'Genre' cell contains 'PG', 'Certificate' contains 'PG-13', 'Rating' contains 'G', and 'Rental Price' contains 'R'. Below these cells, a row of counts is shown: 4 under PG, 11 under PG-13, 1 under G, and 4 under R.

COUNT function input in formula bar and in brackets to the cells to be checked, and the value it will be counting

ABSOLUTE REFERENCING

Absolute referencing is used when the value in a specific cell is required in a formula, and that formula is then copied to multiple cells, but the reference cell needs to stay the same, rather than being changed to suit the location of the other cells the formula is being copied to. Management had requested information regarding the gaps of tickets sold at the cinemas against the number one film. The reason for this was that they wanted to know if the number one film sold more tickets than the others by a large majority. If so, advertised would be heavily focused around that, but if there were no large gaps in the tickets sold, then advertising would be spread more generally between the films. Therefore I had to make sure that the tickets sold for the number one film was the only cell referenced when working out the gap between the other films

\$ symbols used before the letter and number of the cell reference so tell Excel the cell is absolute

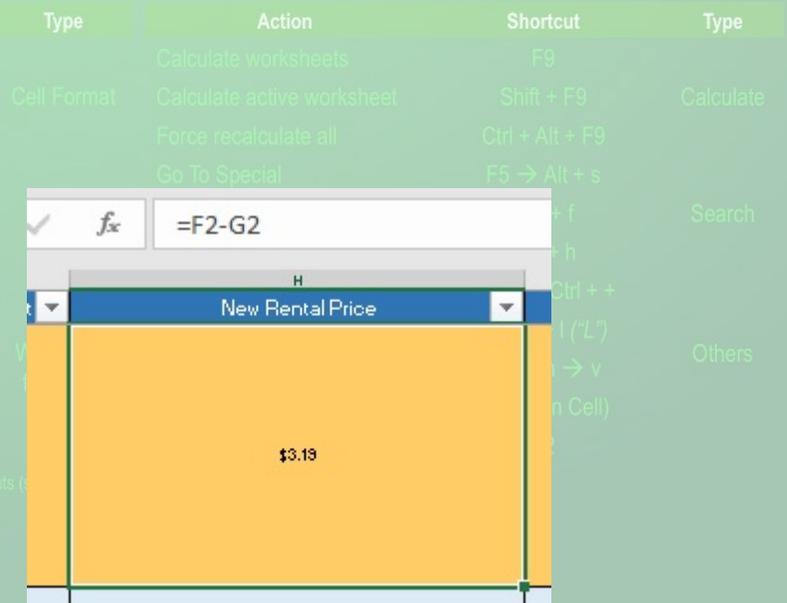

The screenshot shows the Excel formula bar with the formula `=F2-G2`. The active cell is P2, and the formula bar shows `=F2-G2`. The spreadsheet below shows columns O, P, and Q. Column O is labeled 'Tickets Sold' and contains the value 50,078,683. Column P is labeled 'Ticket Gap To No. 1 Film' and contains the value 227,869. Column Q is labeled 'Distributor' and contains the value 'Lionsgate'.

RELATIVE REFERENCING

Referring back to the deduction on the rental price of a film if certain criteria were met, I needed a way that would work out the new rental price of a film for all 20 films without having to manually complete the process for each film. Excel has the ability to copy a formula and then change the reference cell in relation to what cell the formula was copied from, so that the value it used would go down a cell every time the formula was copied down a cell, as opposed to absolute referencing, where the value cell would stay the same

\$ not used here so that when the formula is copied down to next cell, the formula changes so that reference cell also moves down one cell

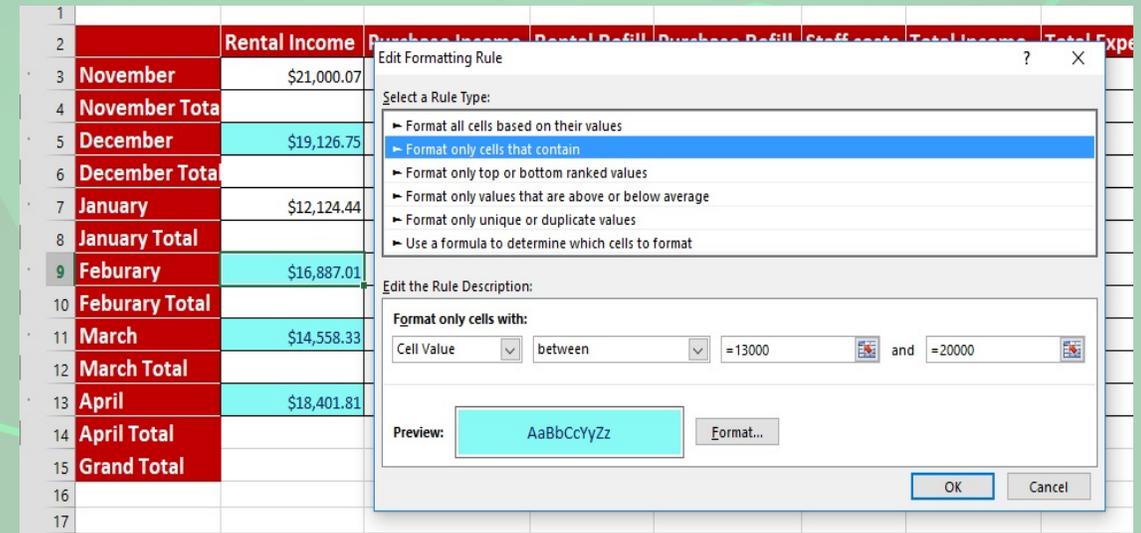

The screenshot shows the Excel formula bar with the formula `=F2-G2`. The active cell is H2, and the formula bar shows `=F2-G2`. The spreadsheet below shows column H labeled 'New Rental Price' and contains the value \$3.19.

	Force recalculate all	Ctrl + Alt + F9	
	Go To Special	F5 → Alt + s	
			Search
			Others

CONDITIONAL FORMATTING

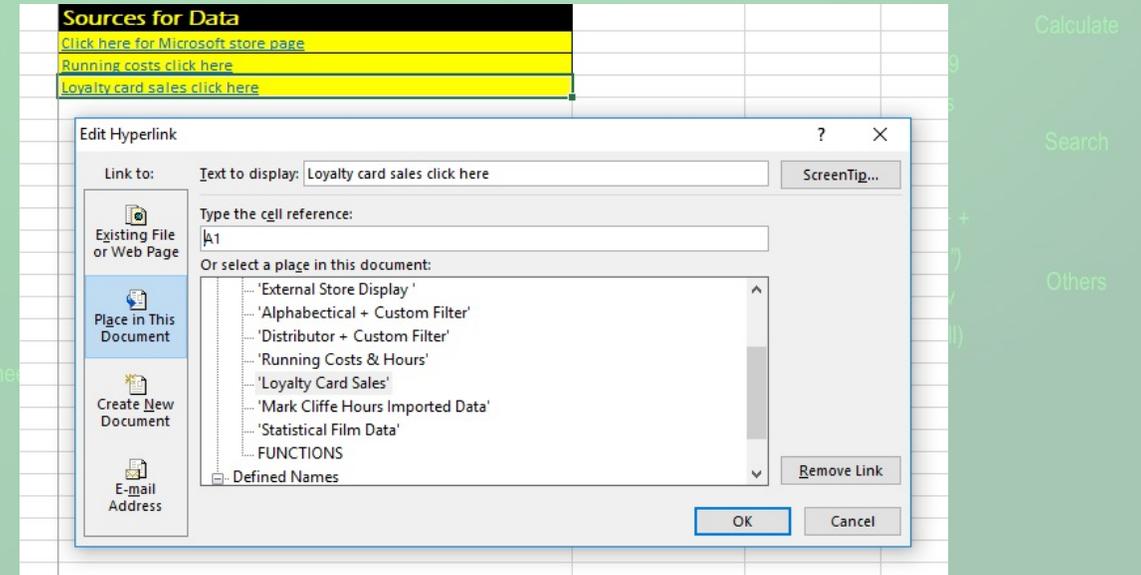

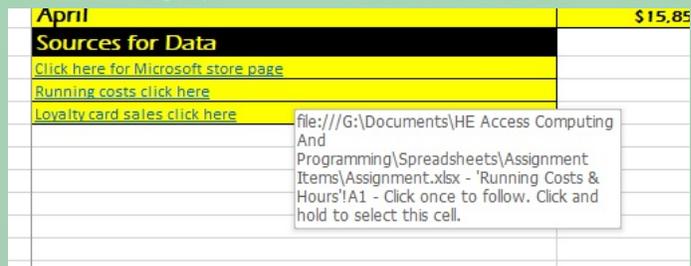

I wanted to use this feature so that information could be visually presented easier when showing figures to management. I wanted to highlight the occasions that rental income was between \$13,000 and \$20,000 as these would be the months used to cover any shortfall in profits from traditionally quieter months for rentals (e.g. January), so I used the tool that would highlight these cells in a different font and background colour so that management could easily see this information

This comes up so that the conditions can be set and what the cell will look like when those conditions are met. In this, the cell value is between \$13,000 and \$20,000

LINKING TO OTHER SHEETS

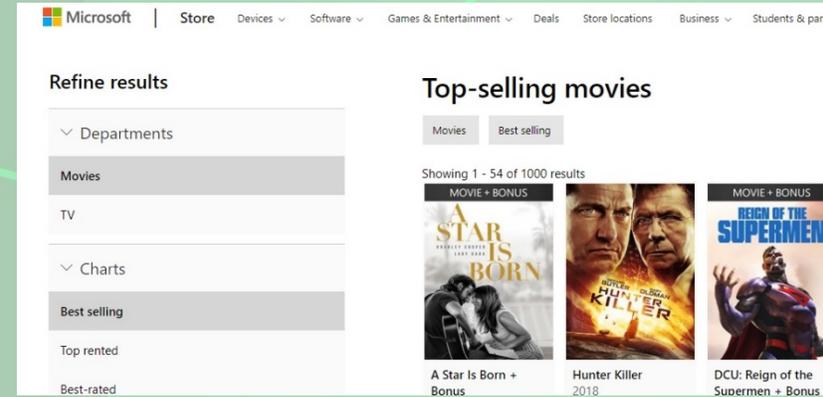

I wanted to be able to link sheets together as having multiple sheets in a workbook can become time-consuming to navigate. Having created my at-a-glance section for management, I wanted to put a link in so that they could easily access the sheet that contained running costs, rather than having to manually find it, with the same function added for the sheet containing loyalty card sales

HYPERLINKS TO WEBSITES

I needed to insert a hyperlink to Microsoft's online film store as that is what the information that our store would use is based on, so I wanted management to easily access the store if they want to check if any of the information I gathered was incorrect or had changed

Sources for Data	
Click here for Microsoft store page	https://www.microsoft.com/en-us/store/movies-and-tv/browse/top-selling?type=movies - Click once to follow. Click and hold to select this cell.
Running costs click here	

PIVOT TABLE

A pivot table can be very useful for the store when trying to see which distributors are useful for which categories. Management had wanted a table to be created that took into the distributors, the genres and the ratings of all the twenty films and present them in a way so that we could see what the strongest genres are for distributors. With the pivot table we were able to find out not only which genres had the most representation among the distributors (which helps with allocating space for genres in the store), but we could also see which distributor's films scored the highest star ratings in the genres, which would help when trying to work out which distributors we could trust the most for film quality, which is vital for the success of our store

Count of Rating	Column Labels				Grand Total
Row Labels	1	2	3	4	Grand Total
Action	2	3			5
Paramount Pictures		1			1
Universal			1		1
Walt Disney			2		2
Warner Bros.		1			1
Adventure	2	5			7
20th Century Fox	1				1
Lionsgate		1			1
Paramount Pictures			1		1
Universal			1		1
Walt Disney		1	1		2
Warner Bros.				1	1
Comedy	2	1	1		4
20th Century Fox			1		1
Sony Pictures	1				1
Universal		1			1
Warner Bros.			1		1
Drama		1			1

This table shows the star ratings along the top and how many of which film by which distributor in which genre got how many stars

FREEZE TITLES/FREEZE PANES

Some of the sheets in my workbook are quite large but require checking in a number of categories quite regularly. I wanted to be able to keep the column showing the position of the film (e.g. the highest selling film at number one and the 20th best selling film at number 20), while being able to scroll across different columns so that I could compare information. I used the Freeze tool for this so that number column would not move. I also though wanted the same ability for if I was scrolling down the sheet, so then I would always know the title of the column, so that I would still be able to know which category the values represented without having to scroll back up to the top of the sheet

	A	G	H	I
1		Rental Discount Amount	New Rental Price	Purchase Price
7		\$0.80	\$3.19	\$17.99
8				

Scrolling down to the number seven film, but the titles move along with it so I know what the column is about

	A	B	C
1		Title	Genre
1		Iron Man 3	Action
2		The Hunger Games: Catching Fire	Adventure

The sheet keeps scrolling across, but the number column stays on the left but does not disappear from view

	A	E	F
1		Rating	Rental Price
1		4	\$3.33
2		4	\$3.33

OBJECT LINKING

As part of setting up a new store, printed sheets have to be prepared to give management six-monthly reports. Instead of trying to type up all the information in a Microsoft Word document, or trying to print off separate sheets from my workbook, it is simpler and looks more professional to embed the data from the workbook in the Word document. So using the Copy function in Excel and then using Paste and Paste special in Word, I am able to copy across the required tables and charts, and also have them update in the Word document when they are updated in the workbook

	Rental Income	Purchase Income	Rental Refill	Purchase Refill	Staff costs	Total Income	Total Expenditure	Total Profit/Loss
November	\$21,000.07	\$30,000.78	\$300.00	\$15,579.00	\$10,000.65	\$51,000.85	\$25,879.65	\$25,121.20
December	\$19,126.75	\$45,001.25	\$300.00	\$16,576.27	\$14,125.20	\$64,128.00	\$31,001.47	\$33,126.53
January	\$12,124.44							
February	\$16,887.01							
March	\$14,558.33							
April	\$18,401.81							

The store's total profit/loss ratio remains high, with only one month (January) presenting a loss, seen here

The Excel workbook has updated since the data was put into the Word doc, so Word asks if I want to update the data

EXPORTING DATA

Exporting data is useful for when I need to show data in the printed reports (like the Object Linking feature). Copying and pasting into the Word doc, I am able to highlight just the two columns I feel are most important when the producing the report showing over the last six months our total expenditure and total profit/loss

Total Expenditure	Total Profit/Loss
\$25,879.65	\$25,121.20
\$31,001.47	\$33,126.53
\$22,895.63	-\$2,770.74
\$22,847.63	\$3,050.02
\$25,417.98	\$4,727.76
\$20,000.22	\$15,852.74

The two columns are copied and then pasted into a Word doc so that they can be printed along with text

Total Expenditure	Total Profit/Loss
\$25,879.65	\$25,121.20
\$31,001.47	\$33,126.53
\$22,895.63	-\$2,770.74
\$22,847.63	\$3,050.02
\$25,417.98	\$4,727.76
\$20,000.22	\$15,852.74

A context menu is open over the table with options: Cut, Copy, Paste Options, Paste Special..., Insert..., Delete..., Clear Contents, Quick Analysis, Filter.

HLOOKUP/VLOOKUP

The HLOOKUP and VLOOKUP functions are useful for when trying to work out overtime pay. The more overtime staff put in, the higher percentage increase of overtime pay they will receive. Rather than having to try and manually work out all the percentage increase overtime pay with a calculator, the HLOOKUP and VLOOKUP functions can be used to reference data running horizontally or vertically across set tables so overtime pay can be worked out much quicker

Formula bar: `=HLOOKUP(C28,B20:G21,2)`

A	B	C	D	E	F	G
	Overtime pay percentage per extra hours worked (up to each value)					
	5	10	15	20	25	30
	0%	5%	10%	15%	20%	25%
	Jane Galloway					
	Staff no. M125					
	Full time hours	37.5				
	Full time hours worked?	YES				
	Overtime hours worked	15				
	Overtime % to add to pay	10%				

Formula bar: `=VLOOKUP(C35,I20:J25,2)`

B	C	D	E	F	G	H	I	J
0%	5%	10%	15%	20%	25%		10	0.05
							15	0.1
							20	0.15
							25	0.2
							30	0.25

Employee Data:

Mark Cliffe	
Staff no. M127	
Full time hours	37.5
Full time hours worked?	YES
Overtime hours worked	25
Overtime % to add to pay	20%

Rental Income Chart:

The VLOOKUP is using vertically aligned data to work out what overtime percentage pay the employee will receive

The HLOOKUP is using horizontally aligned data to work out what overtime percentage pay the employee will receive

SORTING

In the stock system, film titles needed to be arranged alphabetically to help locate files and stock when required. Trying to create a new sheet and manually work out the list would take too long, and would only have to be done again every time a new film was added. Using Excel's Sorting tool, this means the twenty film titles could easily be arranged in alphabetical order so that stock could be re-arranged straight away. The management also wanted this to be done by the names of distributors on a separate sheet to help when creating distributor-specific offers

	A	B	C
1			
2			
3		Title	Genre
3		Despicable Me 2	Adventure
4			
8		Fast and Furious 6	Action
5			
4		Frozen	Musical
6			
7		Gravity	Thriller/Suspense
7			

The films are sorted by distributor. As numbers come before letters in the system, 20th Century Fox films start at the top

The films are sorted by film title alphabetically, so 'Despicable Me' starts at the top, but the number placement doesn't change and stays the same (it was the number three highest selling film)

N	O	P	Q	R
2013 US Gross	Tickets Sold	Ticket Gap To No. 1 Film	Distributor	Stock
\$187,168,425	23,021,946	0	20th Century Fox	
\$153,581,587	19,628,731	3,393,215	20th Century Fox	
\$407,139,699	50,078,683	-27,056,737	Lionsgate	

FILTER & CUSTOM FILTER

Management had also requested specific information for getting ready to setup up the online store. In the first request, management wanted to be able to see which films were between 102 and 127 minutes in length, as this the server space (and therefore data amounts) films in this time range would take is where we could get the best server deals. Films longer or shorter than these set amounts would not represent good value when setting up the online store. Management had requested the alphabetical order of the film titles be kept, but with this new filter inserted. Management had also requested a separate filter to be inserted so that they could easily choose to see which of the twenty films had been supplied by specific distributors

Amount	New Purchase Price	Release Date US	Length In Minutes	2013 US Gross	Tickets Sold	Ticket Gap To No. 1 Film	Distributor	Stock
#VALUE!		22/03/2010	98	1187,166,425	23,021,946			

The films can now be viewed by certain distributors if chosen, or all can be selected

count Amount	New Rental Price	Purchase Price	Purchase Price Discount Amount	New Purchase Price	Release Date US	Length In Minutes
\$0.80	\$3.19					111

The data range set here is between 102 and 127 minutes, using the custom filter only films matching this criteria will be displayed

→ = press keys after each other + = press keys at the same time () = additional hint Note: Some shortcuts (such as "%" or "F") may require additional keys (such as "Shift")

WHAT-IF?

I had wanted to create an external display that would go out on a pavement area to try and direct attention to our store and increase pre-order rental incomes. There were a number of displays I could choose from, ranging from small to extra large. With the different sizes would come different costs for things like insurance and labour, but would also present the opportunity for increased income based on how much attention the display would grab. I wanted to assess though which size display would present the opportunity for most profit, so I set up the What-If analysis to take into the account the different costs and potential incomes, which were the presented in a table format that I could easily show the comparison to management

External store display event to encourage pre-orders for 2019 films	
Costs	
Labourers	£300.00
Space rental	£175.00
Sound system	£200.00
Lighting	£200.00
Insurance	£350.00
Display cases	£20.00
Staff T-shirts	£25.00
Total costs	£1,270.00
Expected revenues from event	
Pre-orders	£300.00
Loyalty cards	£215.00
Existing film rentals	£900.00
Total revenue	£1,415.00
Profit/loss	£145.00

Scenario Manager ? X

Scenarios:

- Small Display
- Medium display
- Large Display
- Extra Large Display

Changing cells: \$C\$6:\$C\$12,\$C\$17:\$C\$18

Comment: Costs and revenues from an extra large display display

The scenarios are created individually with different values input

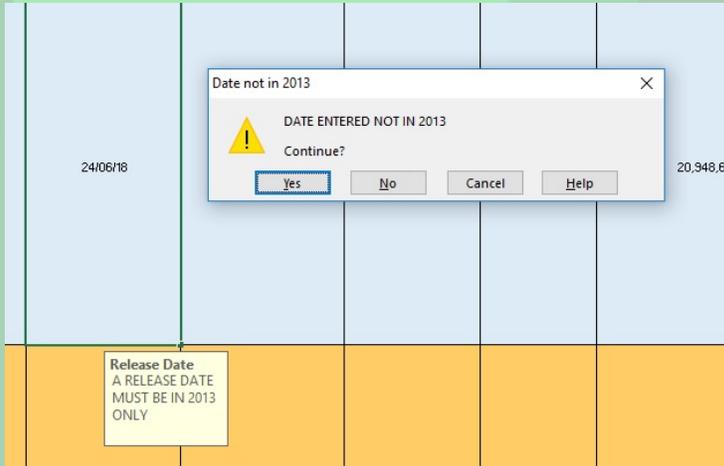

Scenario Summary						
Changing Cells:	Current Values:	Small Display	Medium display	Large Display	Extra Large Display	
\$C\$17	£700.00	£300.00	£400.00	£500.00	£700.00	
\$C\$12	£25.00	£25.00	£25.00	£25.00	£25.00	
\$C\$11	£50.00	£20.00	£30.00	£40.00	£50.00	
\$C\$10	£600.00	£350.00	£450.00	£600.00	£600.00	
\$C\$9	£600.00	£200.00	£200.00	£400.00	£600.00	
\$C\$8	£450.00	£200.00	£275.00	£350.00	£450.00	
\$C\$7	£600.00	£175.00	£300.00	£500.00	£600.00	
\$C\$6	£600.00	£300.00	£450.00	£550.00	£600.00	
\$C\$18	£500.00	£215.00	£315.00	£415.00	£500.00	
Result Cells:						
\$C\$22	-£825.00	£145.00	-£115.00	-£650.00	-£825.00	

Notes: Current Values column represents values of changing cells at time Scenario Summary Report was created. Changing cells for each scenario are highlighted in gray.

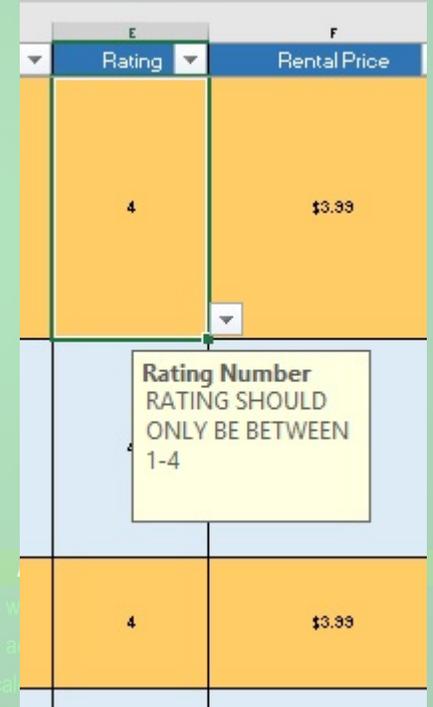

The results are then presented in a table in a scenario summary

DATA VALIDATION & DATA VALIDATION WITH DROP-DOWN LIST

When staff were entering the data about films into the workbook, I needed to make sure that limits were placed on the information entered. Since we were referring to films released in 2013, I needed to make sure staff only entered film release dates that could have occurred during 2013 so that none of the data was invalid. To do this, I set up validation to warn staff if they had entered a date that was not valid. I also wanted to set up a separate data validation with a drop-down list for the star ratings, as all the films had only scored between one and four stars, so I inserted the drop-down list so that staff could easily input a number that would not lead to invalid data

The validation will give a warning when an date not in 2013 is entered

The drop down list ensures only numbers between 1 and 4 can be input

Type	Action	Shortcut	Type	Type

→ = press keys after each other + = press keys at the same time () = additional hint Note: Some shortcuts (such as "%" or "F") may require additional keys (such as "Shift")

CHARTS

Visually representing data is important when trying to show information to management when trying to persuade them to take a course of action. A number of charts and graphs are used in work book, tracking the changes of income from rentals and the sales of loyalty cards so that I could try and persuade management that the cards and rentals were worth persevering with enough if the figures had started out initially low, and I would not have been able to do this with visually flat numbers and cells alone

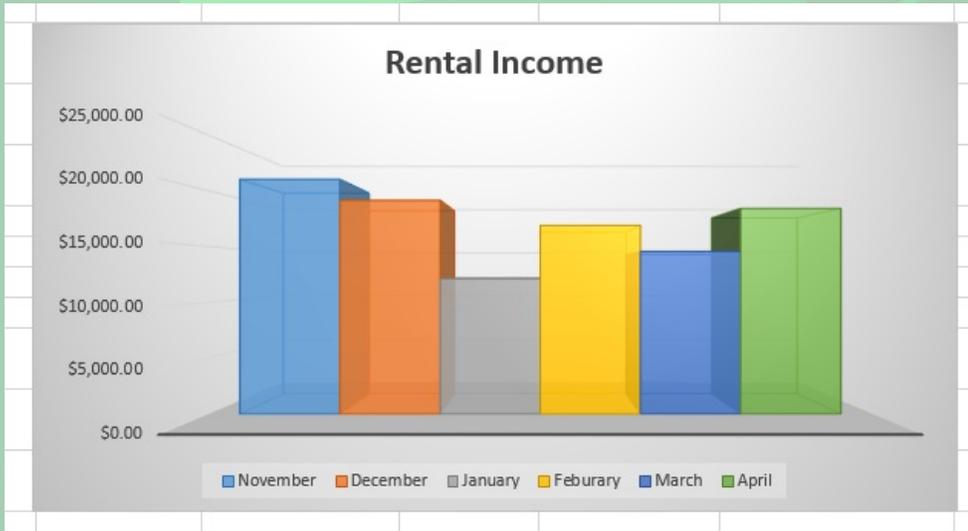

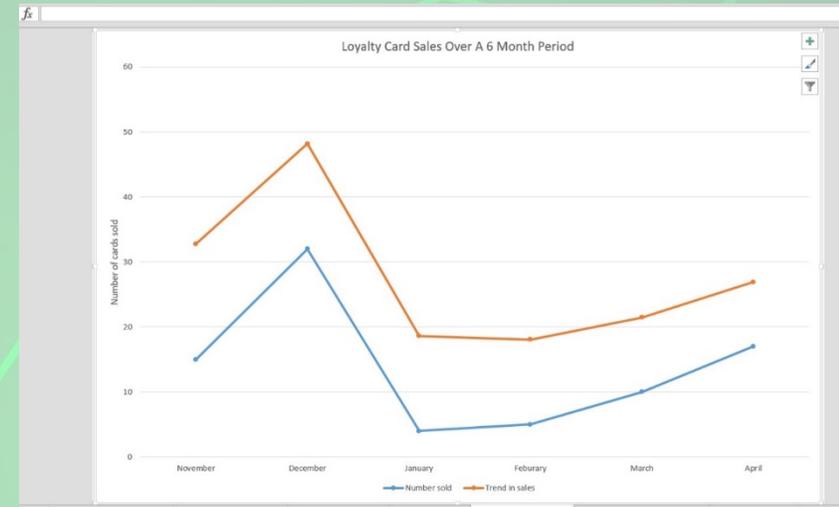

Chart showing just the rental income over the last six months

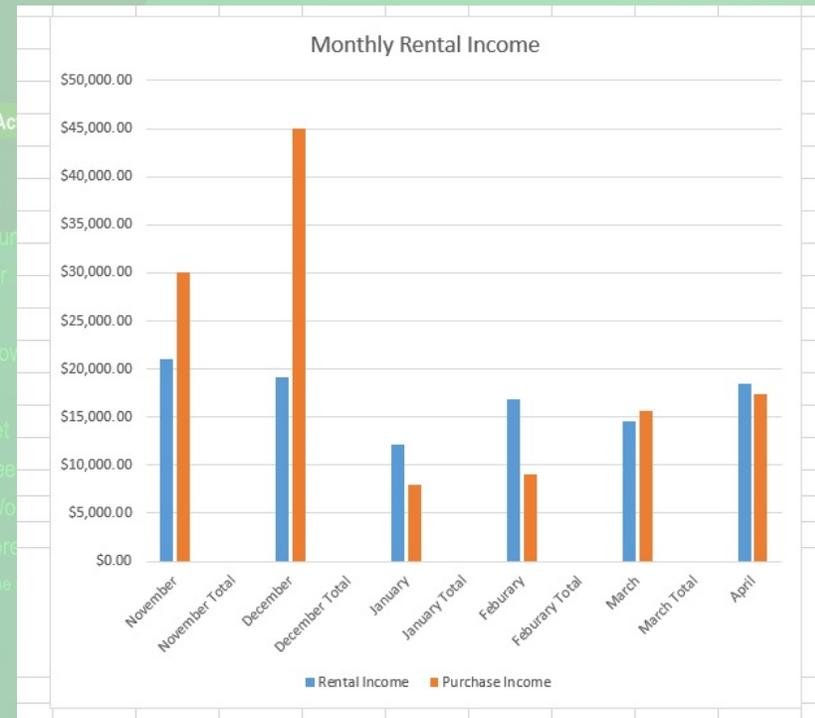

Chart the rental and sales income together in comparison

IMPORTING DATA

The use of data import has been required for when staff submit their hours worked via electronic format. Some choose to write down their hours worked, but a few send in the data of their hours worked in a text document via email. Whereas I have no option but to manually type in the hours from the hand written forms, I can import the data from the electronic text documents. In this example Mark has sent in his hours worked in a simple text document. Handily, mark has used a comma to separate the days, times and any overtime worked for me. This means that when I import the data from the text document, I can use the comma value as a separator between the fields, which makes the data readable and separated into cells in Excel for me

Mark Cliffe Hours wc 24012016

The file containing the text is sent to me

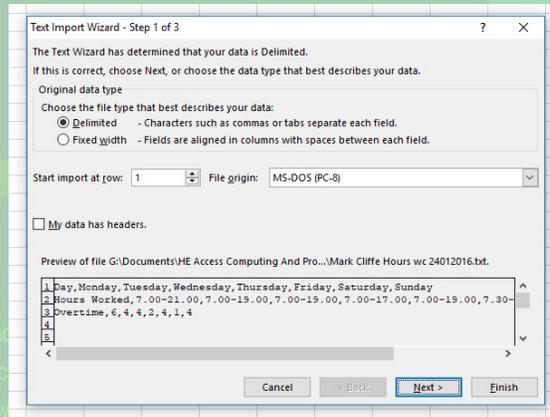

The data has been separated with commas

Mark Cliffe Hours wc 24012016 - Notepad

File Edit Format View Help

```
Day, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday
Hours Worked, 7.00-21.00, 7.00-19.00, 7.00-19.00, 7.00-17.00, 7.00-19.00, 7.30-16.30, 08.00-20.00
Overtime, 6, 4, 4, 2, 4, 1, 4
```

I then tell Excel to use those commas to separate the data

Shortcut

Ctrl + 1

Ctrl + %

Ctrl + !

Ctrl + Shift + I (/L)

Alt → a → c

Alt + Arrow down

Alt → o → h → h

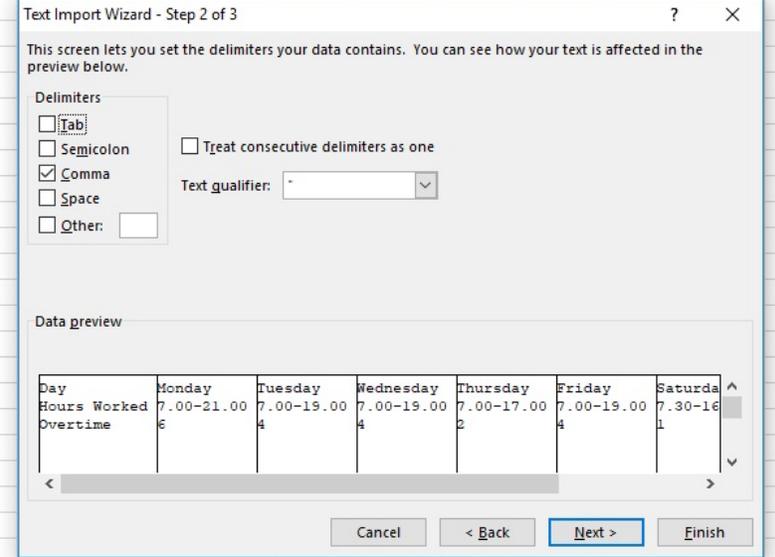

Alt → o → h → u

Alt → o → h → r

Alt + Shift + F1

Ctrl + Page up/ Page down

additional hint Note: Some shortcuts

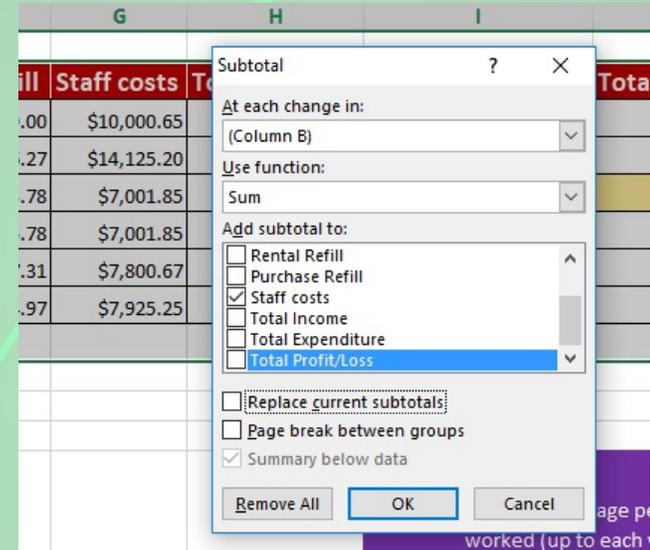

Excel is then able to divide the data in separate cells so that they are immediately useable

A	B	C	D	E	F	G	H	I	J
	Day	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday	Sunday	
	Hours Worked	7.00-21.00	7.00-19.00	7.00-19.00	7.00-17.00	7.00-19.00	7.30-16.30	08.00-20.00	
	Overtime	6	4	4	2	4	1	4	

SUBTOTAL & OUTLINE

The SUBTOTAL function has been useful for showing admin staff items like staff costs, as the function can create a line between each row and calculate the subtotal. In this example we are using it for giving us a subtotal between each month for the staff costs. This also adds an outline so that it so I can collapse specific months if I have already seen that data for the month

Excel is told which column to use for the automatic subtotals

The outlines are then created, each can be collapsed if required for easier viewing

			Rental Income	Purchase Income	Rental Refill	Purch	Shortcut	Type	Action	Shortcut	Type
2											
3	[-]	November	\$21,000.07	\$30,000.78	\$300.00		Ctrl + 1		Calculate worksheets	F9

Note: Some shortcuts (such as "%" or "I") may require additional keys (such as "Shift")

ARRAY FORMULA

Management had been enquiring about the numbers of customers signing up for loyalty cards over the last six months, as there was debate about whether to keep offering incentives to sign up if the trend in sales was going down. I thought the best way to show this visually was using an Array Formula, as then I could use it to track the trends and work out if there was a best time to push the cards and when to hold back producing any more, depending on the month

I start off with the data of how many cards were sold in each month

1							
2							
3		November	December	January	February	March	April
4	Number sold	15	32	4	5	10	17
5							

B5				: X ✓ fx				{=TREND(B4:G4)}			
	A	B	C								
1											
2											
3		November	December	Ja							
4	Number sold	15	32								
5	Trend in sales	17.76	16.19								

Cells B5 and C5 both contain the same data (the {} are automatically used in this TREND) so that Excel can work out the trend of sales

C5				: X ✓ fx				{=TREND(B4:G4)}			
	A	B	C								
1											
2											
3		November	December	Ja							
4	Number sold	15	32								
5	Trend in sales	17.76	16.19
